

Sample Document for pdf_to_speech.py

This is a short sample PDF, made so you can test the pdf to speech script without needing to track down a real document first. If you can hear this sentence read aloud, the pipeline is working end to end: the script found the file, pulled the text out of it, and handed that text to a speech engine.

A good way to test the page range option is to try converting only page two of this document. That option accepts a spec like one dash five, comma, eight, which lets you convert a handful of pages instead of the whole file.

Page Two

Here is the second page. It exists mainly so you have something to point the pages option at. Try running the script with pages set to two, and you should hear only this paragraph read aloud, not the text from page one.

That is the end of the sample document. Once this works, try it on a real PDF of your own, such as an article, a chapter of a book, or a set of notes.
